

Slope Applications:

Draw a diagram, label the diagram and do the appropriate calculations.

1. Adam wants to build a loading ramp. He knows that the slope he would like is 0.19 and the space that he has to work in allows for a total run of 30 feet.
 - a) What would be the height of his ramp?
 - b) What angle does the ramp make with the ground?
 - c) What is the length of the ramp?
2. George has to build a 6-step staircase from his back deck to the yard. The deck is 60 inches off the ground and the run of the stairs is to be 90 inches.
 - a) What is the slope of the staircase?
 - b) What is the rise and run of each step?
 - c) What is the slope of each step?
3. The safety standard for using a ladder is defined as the 1/4 rule. Translated this means that for every four feet the ladder reaches up a wall, the base should be a foot away from the wall.
 - a) If the base of a ladder is placed a distance of 4.2 feet from the wall, at what height would the top of the ladder safely touch the wall?
 - b) If a ladder touches the wall at a height of 10 meters, where should the base of the ladder be placed in relation to the wall? How long a ladder should be used if we take into account that this extension ladder should have a safety overlap of 1.5 meter?
4. George has been hired to build a wheel chair ramp. The building code calls for a rise of 1 inch for every 12 inches.
 - a) What would be the run of a ramp if the required rise is 6 feet?
 - b) How high would a ramp reach if the run of the ramp was 46 feet?
 - i) What angle does the ramp make with the ground?
 - ii) How long would the ramp be?
5. A group of friends are hiking at Baniff National Park. They have hiked up a trail that has a run of 4.3 km with a calculated slope of 0.67.
 - a) If we assume they start at an elevation of 3000m, at what elevation would they be after completing their hike?
 - b) What would the average angle of their climb?
 - c) What distance have they covered in their climb?
6. Many roads and highways have signs giving the percentage grade for the road. A 9% grade, for example, means that the altitude changes by 9 feet (meters) for each 100 feet (meters) of horizontal distance.
 - a) Suppose an uphill road sign indicates a road grade of 15%. What is the angle of elevation of the road?
 - b) If a road has a grade of 7%, what would be the travelers change in elevation in a horizontal distance of 3.1 km?

7. Lauren's savings account balance changed from \$820 in January to \$1260 in October. Find the average rate of change (slope) per month. Round your answer to the nearest dollar.
8. If Shauna bought a house in 1992 for a cost of \$197,000 and had an appraisal done in 2011 and found out the value of the house was now \$326,000. Find the annual rate of change in the value of the house in dollars per year. (round off to the nearest dollar)
