

## Some Properties Of The Real Numbers

A real number is either a positive number, a negative number, or zero and may be classified as a:

- a) **rational** - a number that can be expressed as a ratio of two integers. These include integers, positive and negative fractions, terminating decimals, and non-terminating repeating decimals. Examples: -5, 3,  $\frac{2}{7}$ ,  $-\frac{4}{5}$ , 2.45, -0.00561, 0.6666..., -3.456456...
- b) **irrational** - any number that is not rational. Examples:

$$\sqrt{17} = 4.1231\dots, \quad \pi = 3.14159\dots, \quad \tan \frac{8\pi}{9} = -0.364\dots$$

### Fundamental Properties of the Operations of Addition and Multiplication. {a, b, and c are real numbers}

- |                             |                                                                                                                            |                  |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------|------------------|
| 1. Commutative Laws:        | $a + b = b + a$                                                                                                            | $ab = ba$        |
| 2. Associative Laws         | $a + (b + c) = (a + b) + c$                                                                                                | $a(bc) = (ac)b$  |
| 3. Distributive Law         | $a(b + c) = ab + ac$                                                                                                       |                  |
| 4. Identity Elements        | $a + 0 = a$                                                                                                                | $a \times 1 = a$ |
| 5. Existence of Negatives   | $a + (-a) = 0$                                                                                                             |                  |
| 6. Existence of Reciprocals | every real number $a \neq 0$ has a reciprocal, denoted by $\frac{1}{a}$ , such that $\underline{a \times \frac{1}{a} = 1}$ |                  |
| 7. Zero Product Property    | $ab = 0$ if and only if $a = 0$ or $b = 0$                                                                                 |                  |

# Inequalities

## Definition:

a) The symbols  $<$  (“is less than”) and  $>$  (“is greater than”) are defined as follows:

1.  $a < b$  if and only if  $b - a$  is positive

2.  $a > b$  if and only if  $a - b$  is positive

b) The symbols  $\leq$  (“is less than or equal to”) and  $\geq$  (“is greater than or equal to”) are defined as follows:

1.  $a \leq b$  if and only if either  $a < b$  or  $a = b$

2.  $a \geq b$  if and only if either  $a > b$  or  $a = b$

## Properties:

1. If  $a < b$  and  $b < c$ , then  $a < c$

2. If  $a < b$ , then  $a + c < b + c$ , if “ $c$ ” is any real number

3. If  $a < b$  and  $c < d$ , then  $a + c < b + d$

4. If  $a < b$ , and “ $c$ ” is any positive number, then  $ac < bc$

5. If  $a < b$ , and “ $c$ ” is any negative number, then  $ac > bc$

6. If  $a > b$  and  $b > c$ , then  $a > c$

7. If  $a > b$ , then  $a + c > b + c$ , if “ $c$ ” is any real number

8. If  $a > b$  and  $c > d$ , then  $a + c > b + d$

9. If  $a > b$ , and “ $c$ ” is any positive number, then  $ac > bc$

10. If  $a > b$ , and “ $c$ ” is any negative number, then  $ac < bc$

# Infinity

Symbols:  $\infty \rightarrow$  infinity

$+\infty$  or  $\infty \rightarrow$  positive infinity

$-\infty \rightarrow$  negative infinity

$(-\infty, +\infty)$  or  $(-\infty, \infty)$

denotes the set of all real numbers

## Unbounded Open Interval

$(a, +\infty)$  denotes: a) the set of all numbers greater than a  
b) the set of all real numbers  $x$  such that  $x > a$

## Unbounded Closed Interval

$[a, +\infty)$  denotes a) the set of all numbers greater than or equal to a  
b) the set of all real numbers  $x$  such that  $x \geq a$

## Unbounded Open Interval

$(-\infty, b)$  denotes: a) the set of all numbers less than b  
b) the set of all real numbers  $x$  such that  $x < b$

## Unbounded Closed Interval

$(-\infty, b]$  denotes: a) the set of all numbers less than or equal to b  
b) the set of all real numbers  $x$  such that  $x \leq b$

# Absolute Value

If  $a$  is a real number, then the absolute value of  $a$  is:

$$|a| = \begin{cases} a, & \text{if } a \geq 0 \\ -a, & \text{if } a < 0 \end{cases}$$

The absolute value of a number cannot be negative.  
The symbol  $-a$  does not necessarily mean that  $-a$  is negative.

**Operations with absolute values:** (let  $a$  and  $b$  be real numbers and  $n$  a positive integer)

$$\begin{array}{ll} 1. |ab| = |a| |b| & 2. \left| \frac{a}{b} \right| = \frac{|a|}{|b|}, \quad b \neq 0 \\ 3. |a| = \sqrt{a^2} & 4. |a^n| = |a|^n \end{array}$$

## Properties of inequalities and absolute values

(let  $a$  and  $b$  be real numbers and  $n$  a positive integer)

$$\begin{array}{l} 1. -|a| \leq a \leq |a| \\ 2. |a| \leq k \text{ if and only if } -k \leq a \leq k \\ 3. k \leq |a| \text{ if and only if } k \leq a \text{ or } a \leq -k \\ 4. \text{ Triangle Inequality } |a + b| \leq |a| + |b| \end{array}$$

Properties 2 and 3  
are also true if  $\leq$   
is replaced by  $<$

## Distance and Midpoint of an Interval

### Distance:

The distance between two points  $a$  and  $b$  on the real line is given by:

$$d = |a - b| = |b - a|$$

The directed distance from  $a$  to  $b$  is  $(b - a)$  and the directed distance from  $b$  to  $a$  is  $(a - b)$

### Midpoint

The midpoint of an interval with endpoints  $a$  and  $b$  is the average of  $a$  and  $b$ .

$$M = \frac{a + b}{2}$$

# Intercepts of a Graph

X-intercept - the value of  $x$  at the point where the graph cuts the  $x$ -axis.

To find the  $x$ -intercept, let  $y$  be zero and solve the equation for  $x$

Example:

$$y = x^3 - 4x$$

$$0 = x^3 - 4x$$

$$0 = x(x - 2)(x + 2) \quad \text{Factor}$$

$$x = 0, 2, -2$$

Let  $y$  be zero

Factor

Solve for  $x$

Y-intercept - the value of  $y$  at the point where the graph cuts the  $y$ -axis.

To find a  $y$ -intercept, let  $x$  be zero and solve the equation for  $y$ .

Example:

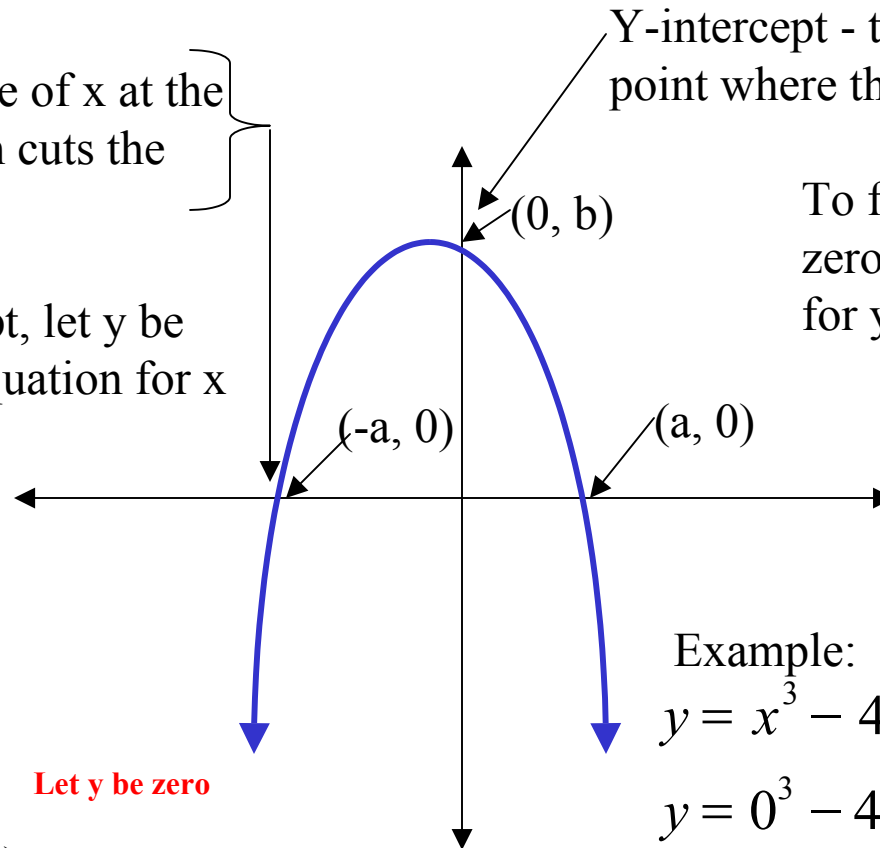

$$y = x^3 - 4x$$

$$y = 0^3 - 4(0)$$

$$y = 0$$

Let  $x$  be zero

Solve for  $y$

# Symmetry of a Graph

1. A graph is symmetric with respect to the y-axis, if whenever  $(x, y)$  is a point on the graph,  $(-x, y)$  is also a point on the graph. This means that the portion of the graph to the left of the y-axis is a mirror image of the portion to the right of the y-axis.

Test

The graph of an equation in  $x$  and  $y$  is symmetric with respect to the y-axis if replacing  $x$  by  $-x$  yields equivalent equation.

Example:

$$\begin{aligned}y &= 2x^2 - 3 && \text{original equation} \\y &= 2(-x)^2 - 3 && \text{replace } x \text{ by } -x \\y &= 2x^2 - 3 && \text{simplify} \\y &= 2x^2 - 3 && \text{equivalent equation}\end{aligned}$$

2. A graph is symmetric with respect to the x-axis, if whenever  $(x, y)$  is a point on the graph,  $(x, -y)$  is also a point on the graph. This means that the portion of the graph above the x-axis is a mirror image of the portion below the x-axis.

Test: The graph of an equation in  $x$  and  $y$  is symmetric with respect to the  $x$ -axis if replacing  $y$  by  $-y$  yields An equivalent equation.

Example

$$\begin{array}{ll}
 x = -2y^2 + 3 & \text{original equation} \\
 x = -2(-y)^2 + 3 & \text{replace } y \text{ by } -y \\
 x = -2y^2 + 3 & \text{simplify} \\
 x = -2y^2 + 3 & \text{equivalent equation}
 \end{array}$$

3. A graph is symmetric with respect to the origin, if whenever  $(x, y)$  is a point on the graph,  $(-x, -y)$  is also a point on the graph. This means that the graph is unchanged by a rotation of 180 degrees about the origin.

Test: The graph of an equation in  $x$  and  $y$  is symmetric with respect to the origin if replacing  $x$  by  $-x$  and  $y$  by  $-y$  yields an equivalent equation.

Example

$$\begin{array}{ll}
 y = 3x^3 - 2x & \text{original equation} \\
 -y = 3(-x)^3 - 2(-x) & \text{replace } x \text{ by } -x \text{ and } y \text{ by } -y \\
 -y = -3x^3 + 2x & \text{simplify} \\
 y = 3x^3 - 2x & \text{equivalent equation}
 \end{array}$$

## Basic Formulas

**Pythagorean Theorem** - states that in a right triangle the hypotenuse **c** and sides **a** and **b** are related by  $c^2 = a^2 + b^2$  and conversely, if  $c^2 = a^2 + b^2$ , then the triangle is a right triangle.

**Distance Formula** - the distance between the points  $(x_1, x_2)$  and  $(y_1, y_2)$  in the plane is given by  $d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$

**Midpoint Formula** - the midpoint is found by averaging the x-coordinates of the two points and averaging the y-coordinates of the two points  $M\left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}\right)$

Example: Find 'x' so that the distance between  $(x, 3)$  and  $(2, -1)$  is 5 and then calculate the midpoint of the line segment joining the two points. Determined points  $(5, 3)$  or  $(-1, 3)$

$$d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2} \quad \text{distance formula}$$

$$5 = \sqrt{(x - 2)^2 + [3 - (-1)]^2} \quad \text{substitution}$$

$$25 = (x^2 - 4x + 4) + 16 \quad \text{square both sides}$$

$$0 = x^2 - 4x - 5$$

$$0 = (x - 5)(x + 1) \quad \text{factor}$$

$$x = 5 \text{ or } -1 \quad \text{solve}$$

$$M\left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}\right) \quad \text{formula}$$

$$M\left(\frac{5 + 2}{2}, \frac{3 + (-1)}{2}\right) \quad \text{substitution}$$

$$M\left(\frac{7}{2}, \frac{2}{2}\right) = \left(\frac{7}{2}, 1\right) \quad \text{simplify}$$

**Slope:** if  $P_1(x_1, y_1)$  and  $P_2(x_2, y_2)$  are any two distinct points on the line  $l$ , which is not parallel to the y-axis, then the slope of  $l$ , denoted by  $m$ , is given by:

$$m = \frac{y_2 - y_1}{x_2 - x_1} = \frac{\Delta y}{\Delta x} \quad \text{where } \Delta \text{ (delta) means " a change in"}$$

The value of  $m$  computed from the formula is independent of the choice of the two points on the given line.

The inclination of a line not parallel to the x-axis is the smallest angle measured counterclockwise from the positive direction of the x-axis to the line. The inclination of a line parallel to the x-axis is defined to be zero. If  $\alpha$  denotes the inclination of a line,  $\alpha$  may be any angle in the interval  $0 \leq \alpha < \pi$

If  $\alpha$  is the inclination of line  $l$ , not parallel to the y-axis, then the slope  $m$  of  $l$  is given by:

$$m = \tan \alpha$$

Two non-vertical lines are parallel if and only if their slopes are equal  $m_1 = m_2$  and they are perpendicular if and only if the product of their slopes is equal to -1.  $m_1 \cdot m_2 = -1$  The slopes are considered negative reciprocals of one another.
